

Proven during heat waves to keep birds alive while saving water.

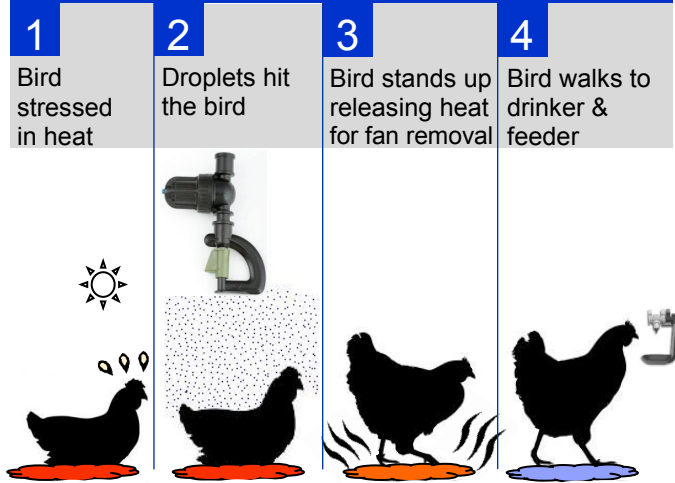

Weeden Sprinkler Systems®

THE ONLY COMPLETE SYSTEM FOR COOLING, ACTIVITY PROMOTION AND DUST CONTROL

- Cools birds without increasing humidity & does not wet litter when used properly
- Year round increased activity to promote weight gain and improve feed conversion
- During heat stress, drastically reduces mortality & backing off feed
- Reduces dust to minimize spread of dust-carried pathogens
- Uses a fraction of the water compared with other cooling systems

THE CONCEPT OF COOLING AND ACTIVITY PROMOTION

Activity promotion causes the birds to eat more often, improving feed conversion.

The Weeden Sprinkler System® turns on in short preset durations. When the Weeden Sprinkler activates, the water droplets hit the birds causing them to stand up and release captured heat underneath.

This reaction promotes activity and the birds migrate to feed and water each time the sprinkler turns on.

With water droplets now on the heads and backs of the birds, the process of “artificial sweating” takes place. Wind chill is then created by moving air across the birds and cooling them as the water droplets evaporate between each sprinkling.
